

To: Air for Life LTD

We have been using the LUNA LNT2 6000 for over 5 years now. Working in an environment like a dental surgery we are always exposed to bacteria and so are always looking for ways to have a healthy and clean environment. We liked that the LUNA sends out negative ions that immobilise and destroy impurities in the air and on surfaces (including bacteria and viruses) rather than waiting for air to pass through a filter which can be time consuming. This is especially important as decontamination and sterilisation is key in dentistry not only for the health of our patients but for the safety of the staff working there. The staff have reported improved nasal health and a reduced instance of hayfever since we had the LUNA in place. This means that there is less time take off by staff for illness. We also find that there is less dust accumulation in the rooms that have the air purifiers.

As the LUNA LNT2 6000 uses NASA developed technology we are confident it is using the most state of the art technology in air purification. We use it in one of the treatment rooms and in our decontamination rooms. We are looking to place a Luna machine in all our treatment rooms and waiting area. We find they are not noisy and so do not disturb us while we are working and patients have commented on how it looks very professional and impressive.

Setting up was easy, just plug and go, and maintenance is minimal. The cartridges need to be replaced approximately 3 years and this is easy to do oneself. Running a busy dental practice means we need simple to use and maintain machines that work brilliantly well without us needing to do much.

We are really happy with our LUNA machines and genuinely feel our practices are a healthier place by having them there.
